1. INTRODUCTION AND BACKGROUND

TRACECA (Transport Corridor Europe Caucasus Asia) has been created by the European Union (EU) as a component of the TACIS interstate programme. The beneficiaries of this programme are eight Republics of the south of the former USSR :

- Armenia
- Azerbaijan
- Georgia
- Kazakstan
- Kyrgyzstan
- Tadjikistan
- Turkmenistan
- Uzbekistan

The objectives of the TRACECA programme are :

- to stimulate co-operation among these eight Republics, to promote the Central Asian - TransCaucasian - Europe Transport Corridor,
- to identify problems and deficiencies in the region's trade and transport system,
- to define in terms of contents and timing a Technical Assistance Programme to be financed by the European Union (EU)

The TRACECA route has been defined as follows :

Poti (Georgia) via Tbilisi to Baku, including the loop line via Armenia, and across the Caspian Sea by ferry to Krasnovodsk and Aktau; then onward by rail from Krasnovodsk through Ashkahbad to Dushanbe (Tadjikistan), Tashkent, Bishkek (Kyrgyzstan, Almaty and Druzhba), and also from the port of Aktau via Makat, Oktjabersk, Aralsk to Chimkent.

The TRACECA project has been conceived with the rail mode as the principal focus of attention. However the ports and shipping links in the Caspian Sea are integral parts of the TRACECA routes.

2. OBJECTIVES OF THE STUDY

The aim of this study is :

- to collect tariffs, travel times, secondary constraints (such as taxes, duties, insurance premium...) and rules of application, from shipping companies, railways, and road forwarders,
- in order to
 - determine the cost and the travel time of different transport modes for various international routes from/to Europe to/from Central Asia,
 - compare the results obtained,
 - assess the competitiveness of the TRACECA routes.

Because of the rapid economical and structural evolution of the TRACECA routes, the outcomes should be considered as representatives of the situation in the area by the time of the realisation of this present survey.

3. METHODOLOGY

3.1 Products, transport modes and itineraries definition

3.1.1 Freight commodities

3.1.1.1 Selection of a representative panel of commodity

We draw our selection of commodities out of the results of two recently realised market studies :

- the « Regional Traffic Database and Forecasting Model » study that seems to be the only available large-scale data source on freight transport
- and the « Freight Marketing study » that was previously realised within the TRACECA program.

One outcome of this latter one is the selection of 13 commodities from the 21 set in the « Regional Database » study. This selection is the following :

Code	Denomination of commodity group
02	Products of vegetal origin
04	Processed food-stuffs
06	Products of chemical industry
07	Plastics and its wares
08	Leather raw materials
09	Wood and its wares
10	Paper and its wares
11	Textiles and its wares
12	Clothing
14	Precious, semi-precious stones and metals
16	Machinery, equipment and mechanisms
18	Devices and appliances
20	Other manufactured goods

Differences of tariff for each commodities group crossing the C.E.I. territory are normally calculated by applying coefficients. In fact these differences are always negated by the results of a negotiation. Thus it appears that the kind of commodity transported is not a criterion for tariff discrimination.

Whatever transport modes used in the C.E.I. or by the other routes, the freight transport prices are contingent only upon two factors :

- the weight,
- the type of packaging, which is linked with the overall dimension.

It should be underlined that to a certain extent, the negotiation and the annual freight volume have a great impact on the tariff that can be obtained.

It appears therefore that studying tariff for each of the 13 commodities selected in the Marketing study will not give more valuable information. We resolve to base our comparison study for each transport modes, on the price per ton tariff of processed food-stuffs since the transport tariff of this particular type of commodity is nearly the average of all the others 13 commodities.

3.1.1.2 Packaging consideration

Different packaging methods are used for freight transport :

- pallet,
- case,
- bundle,
- bale,
- in bulk....

The packaging method determines how the commodities could be transported according to each mode of transport (railway, sea, truck). For example : pallets are usually transported by wagon in railway mode, in bulk commodities can be carrying either by container or by wagon according to commodity itself (sand, textile...).

Also weight and overall dimension determine the kind of the capacity that will be used (i.e. 20' or 40' container or 20-ton or 40-ton wagon) for each mode. Prices are related to the modes and the capacity used.

The final choice of the transport mode to be used is always the sender decision (rail by wagon or by container, sea, truck). On the other hand, the capacity that will be used remains the carrier decision.

The large majority of the commodities transported in western Europe are packaged. It seems that this tend is upon to spread to the Central Asian area. Thus, the study of each carrying possibility available for each commodity will not take this tendency into consideration. A more adequate way of dealing with the problem is to base our analysis on packaged commodity only. That is what we decide to do.

3.1.2 Transport modes

The transport can be realised using mainly three ways :

- railway,
- sea-shipping,
- and truck.

Of course any combination of these three modes is possible; in many cases this would greatly increase both prices and time limits and thus is not realistic.

In order to manage in an understandable way the complexity of various composite transport combination, we decide to focus this study to four representative modes :

- single truck transport,
- single railway container transport,
- single railway wagon transport,
- composite transport (railway-sea shipping-railway).

The composite transport mode that we choose to examine give a competitive alternative to single modes transport.

3.1.2.1 Truck

The reference equipment for this part is a standard semi-trailer truck without satellite phone connection. This type of truck is loaded with a maximum of 20 tons for the general European transit and 18 tons only for the specific transit via Budapest.

This study only focuses on the transport from Europe to Central Asia. Transport operations in the return direction are supposed to be carried out without freight as reliable tariffs are nearly impossible to be obtained in western Europe.

The truck transport is less used than the other modes. It presents some advantages like a door to door delivery, shorter travel time, and greater flexibility.

On the other hand, some disadvantages have to be considered such as :

- security,
- spent time for customs reasons,
- higher tariffs,
- and routes that are not available for some political or civil war reasons

For example :

- relations between Warsaw and Baku/Ashgabat are not deserved by Polish trucks,
- Hungarian trucks do not accept freight for Baku,
- transit through the Tchetcheny region is nearly impossible,
- Rumanian trucks do not accept freight to Central Asia for security reason due to the poor political relation level with the countries of these areas.

3.1.2.2 Railway transport by wagon

The analysis is based on the transport carried out by standard covered railway wagon owned by various railway companies. This kind of wagon is used in all countries for all types of packaged commodities.

Two types of wagons have been considered to calculate tariffs from station to station :

- 2 axles wagon loaded with 20 tons,
- 4 axles wagon loaded with 40 tons.

A transfer of goods between wagon is necessary between European and Russian system and between French and Spanish system, because of the track gauge difference.

3.1.2.3 Railway transport by container

As the transport by container is devoted to continue its spreading especially in Central Asia, the study of the single container transport mode between Europe and Central Asia is the most significant part of this analysis.

The railway transport operations by container are based for the present section on 20' container loaded with 13 tons and 40' container loaded with 22.5 tons. The loading operations are supposed to be accomplished by the sender. The tariffs indicated are station to station prices ; they do not include neither the costs of transport from the sender location to the terminal station nor the unloading costs.

The containers are supposed to be of the last trip type as the Central Asia container transport is still not organised to manage the transit market of containers. Thus tariffs gathered for this mode include the cost of the container itself.

3.1.2.4 Composite transport (railway & sea transport)

As an alternative to single mode routes, the composite transport mode that we choose to analyse combine :

- a railway part from the starting point city to the boarding seaport,
- a sea-shipping part from/to the major European seaports to/from the entrance seaports of the Central Asia area. The seaports of this area that have been retained are Riga, St.-Petersburg, Poti, Batumi and Illiychevsk,
- a railway part from the seaports to the destination city.

To take into consideration the conditions of transport used for each mode and each area, we base our analysis on the following transport condition :

- the railway transports from European cities to European seaport are supposed to be realised only by container 20' or 40'. This assumption is relevant for the majority of the transport made in Europe where the transport carried out by container represents the largest part of the freight market,
- sea-shippings are supposed to be realised by container 20' or 40',
- the railway transport from access seaport to cities of Central Asia are supposed to be realised by wagons of 40 tons as the container transit in this area is still not organised.

3.1.3 Selection of Origin/Destination cities in Europe and Central Asia

The Origin/Destination cities of the itineraries studied must be representative of the whole area studied.

We choose 10 major cities of Western Europe :

- Madrid,
- Bordeaux,
- Paris,
- London,
- Brussels,
- Frankfurt,
- Hamburg,
- Bern,
- Milan,
- and Salzburg.

Furthermore as a large part of the traffic to Central Asia is organised from Central Europe, we select 3 cities of this area :

- Budapest,
- Bucharest,
- and also Warsaw.

Four cities are representative of Central Asia countries :

- Baku is located in Azerbaijan at the west side of the Caspian Sea,
- Ashgabat is the most important town of Turkmenistan,
- Tashkent (2 500 000 inhabitants) is the capital of Uzbekistan and the major city of the area,
- and Almaty the capital of the Kazakhstan, is the easterner of the four cities.

All the relations between these European and Central Asian cities will be described.

To complete this selection, the choice of several seaports allows the realisation of the maritime part analysis.

The relevant seaports selected are, for the western European part :

- Hamburg,
- Trieste,
- Genoa,
- Barcelona,
- Marseilles,
- Dunkirk,
- Rotterdam
- and Felixstowe

and for the eastern European part :

- Constanta,
- Varna,
- St. Petersburg,
- Riga,
- Illiychevsk,
- and Poti.

We selected Batumi too, but the studies of itineraries going through two close ports are not useful. Furthermore, the distance by railway mode between Batumi and Baku is more important than the one between Poti and Baku. So we only keep Poti.

3.1.4 Itinerary determination

3.1.4.1 Existing and used routes

For each land transport mode several itineraries exists.

For trucks, the most used itineraries pass through :

- Poland and Belarus
- Hungary and Ukraine
- Romania and the Black Sea.
- Turkey and Caucasus

For railway mode, the most used itineraries pass through :

- Poland and Belarus (Brest)
- Hungary and Ukraine.
- Germany and the Baltic States (ferry)
- Germany and Finland (ferry)

In the maritime mode, every itinerary between two ports is allowed. Each mode is possible to join the seaports (railway, truck).

Usually the freight of each city is carried by truck or by railway to the nearest port. Riga and St. Petersburg are the most used seaports for Central Asia destinations.

Furthermore, a lot of possible variants are available. For example, the itinerary can be done by railway from Europe to C.E.I. and after by truck.

Anyway the transport mode, and even the itinerary, is chosen by the customer who can have a preference.

The itinerary passing through Aktau and the Caspian Sea to Baku is not available by the time of the present survey. 10 Km of railway are privately owned and thus can not be used for transit. The seaport at Aktau is not serviceable due to the increasing level of the Caspian Sea.

3.1.4.2 Selection of representative routes.

The more frequently used routes have been selected to set up our analysis. These routes are the following :

▪ Truck

The truck routes are made according to the final destination of the shipment. No usual routes exist.

In order to realise our analysis we consider that :

- the trucks travelling to Baku pass through Varna, the Black Sea and Poti,
- all other destinations (Ashgabat, Tashkent et Almaty) pass through Brest and Moscow.

▪ Railway mode

The largest part of the railway transport by 20' container pass through Brest in Belarus. The container transshipment, related to the track gauge difference with the Russian system is made in Brest.

It is a relevant assumption to consider Brest as an compulsory passage point for all itineraries except for the traffic from Milan, Bern, Budapest and Bucharest. For these last four starting points, the transport passes through Zahony at the Hungarian/Ukrainian frontier.

Concerning 20-ton and 40-ton wagons, all the current transit is organised through Brest where transshipment is accomplished.

▪ Composite mode

Two major routes exist. The first one passes through Riga, St. Petersburg, or Illiychevsk. And the second one by the ports of the Black Sea (Poti and Batumi).

The comparison between the classical north routes (by Riga, St. Petersburg) and the south TRACECA routes (by Poti or Batoumi) could show interesting results. This is why we decide to compare for each European cities at least one south route with a north one.

In some cases the European cities are located near various seaports. In those cases all possible itineraries available between the origin city and the various seaports have been analysed. All those routes studied between European cities and seaports can be found in annex herewith attached.

3.2 Customs, security and insurance consideration

Customs is a factor to be taken into consideration when forwarding commodities. It implies additional costs.

It can also cause waiting specially when trucks are concerned. Waiting times can reach several days depending on the borders.

Legislation sometimes varies because of economical protectionism reasons. A recent law can be rapidly set up in order to limit certain transits and allow export development.

Security is also an important point for transits going to or coming from Central Asia.

It is for example recommended, for the C.I.S. part, to always forward two railway containers each together time, (their doors facing each one a other, in order to prevent any opening during the transport).

This recommendation is even compulsory for certain connections.

As far as trucks are concerned, it is often necessary to organise convoys protected by escorts.

Finally concerning insurance, rates for transports towards zones concerned by the study are identical whatever land transport mode used.

As a basis, a relatively high rate of 0,6% can be taken. It may vary according to the value, nature and quantity of commodities. Commodities are insured by the forwarding agent up to the final destination (station, container terminal, residence).

Some commodities are excluded : alcohol, perfumes, hi-fi, video, perishable goods and cars.

3.3 Collect and process data on tariffs and travel times

3.3.1 Tariffs

The complexity of the existing tariff structures led us to choose certain clarifying and pertinent hypotheses to realise our comparisons. These ones can be general or, at the contrary, specific to a mode.

3.3.1.1 General hypotheses

3.3.1.1.1 Tariffs

Tariffs are complex and depend on several criteria :

- The quantity of regular freight to be transported. For instance, forwarding 20' railway container from Paris to Marseilles costs 4633 Francs. This price can be reduced to 3104 Francs per container when forwarding several ones at once.

Our study does not take into consideration any reduction due to the importance of volume. Thus, only one wagon, container or truck per forwarding has been considered as a basis to realise our analysis.

- Tariffs are different in each country. Concerning railway, several countries are crossed and each network determines a price related to covered kilometre and transported volume

These parameters must be taken into consideration.

Shipping tariffs are also different. They have been integrated in price reckoning.

Finally some costs, insignificant compared to the total cost of the transport, have been determined in accordance with the price applied in one of the countries (loading or unloading price for a 20' railway container on a train is estimated to \$35 which corresponds to the tariff in force in Belgium).

- The tariffs we have obtained are different from a company to another, specially for truck or ship transport. somecompanies which only have a destination in C.I.S. are able to offer better prices than transport companies providing a service to several destinations. As far as possible we did what is necessary to obtain representatives prices.

-

3.3.1.1.2 Currency

All tariffs are given in various currencies. We have taken the currency of the country which is crossed or a reference currency as for instance the US dollar, mark, Swiss franc...

All currencies have been converted in US Dollar which is at the present time the most representative currency.

<i>Money</i>	<i>Value in French Francs</i>
DEM	3,37
GBP	10,25
USD	6,11
CHF	4,11
XEU	6,67
ITL	0,00347
ESP	0,04
BEF	0,163

3.3.1.1.3 Calculation mode of the capacities

For each mode of transport, excluding the Russian 40-ton wagon, the price is established per unit (wagon, container). Then price is set per ton. Each unit is supposed to be fully loaded in order to be able to make the calculation.

As far as the Russian wagon is concerned, tariff is established multiplying the number of tons to be transported by the price per ton.

When transferring the commodities, the difference from the real quantity transported in the Russian wagon and the supposed one does not settle any problem.

The tonnage considered per mode is the following :

20-ton wagon	20 tons
40-ton wagon	40 tons
Truck	20 tons
20' container	13 tons
40' container	22,5 tons

3.3.1.1.4 Other aspects

Insurance has been above mentioned. It implies additional costs. The basis of the price is very low compared to the total price (0,6%).

Tariff can vary in a very complex way, according to several criteria (quantity, value, and so on). Nevertheless, this variation is the same for each mode and does not consequently affect the comparison.

On the other hand we can find some special tariffs in case of abnormal, optional or exceptional functioning. We can for example exceed time devoted to a loading, or organise a special convoy in order to have a better security. None of these cases is considered in our study.

3.3.1.2 Specific hypotheses

3.3.1.2.1 Truck

Prices can vary according to the climatic conditions. Our study is based on normal conditions of traffic (no snowing up or black ice).

Additional invoicing can be made when the trucks are immobilised due to consignees or forwarders. The normal time allowed for loading is 24 hours and 48 hours for unloading. Beyond times allowed, immobilising costs rise up to 1500 Francs per day and per vehicle. These standard times are reasonable; possible additional costs are not included in our price calculation.

Truck may also be obliged to wait at borders which can generate rise to a price increase.

This waiting can vary and it is rather difficult to estimate this price increase. Anyway it is globally included in the basic price as forwarders are aware of this phenomenon.

Prices can hardly be negotiated when transport is made by truck.

3.3.1.2.2 Railway container

Nowadays, traffic is made in « last trip » containers mainly 20' as C.I.S. terminals are not sufficiently equipped with handling means to unload 40' containers.

The price of these « last trip » containers depends on both their availability in Western Europe and the demand. For our study the basis price taken is 5900 Francs (USD 966) which corresponds to the present sales price.

Transport of « last trip » container implies several steps (loading, transport, transfer, unloading). The prices indicated in this study include the loading, transport and transfer. Unloading is of the consignee's responsibility.

As well as for trucks, variable additional costs due to delays during loading, unloading or an unforecast immobilisation of the container were not included in our prices.

3.3.1.2.3 Wagon

Price for wagon transport depends on the commodity and its conditioning.

Russia, for instance, applies theoretical coefficients depending on the material transported. These coefficients may change each year. For example, at present time, coefficient applied is 1,5 for machines and 1,2 for cars.

As these coefficients are not applied, we have based our study on not perishable food products which is a good reflect of what is really done.

Negotiation for wagon transport can be very important (up to 50% variation) particularly in Russia. This negotiation is not constant and can not be taken in consideration rationally. As prices indicated supposed to become a reference, would not have been suitable to estimate them on a variable phenomenon such as negotiation. Nevertheless we must be aware of its existence.

Prices, given for two types of wagons (20' and 40'), include transport and transfer in Brest. Loading and unloading are of the consignee's responsibility.

Basic prices are specific to each country. They depend on distance covered and volume transported. Tariffs are consequently very difficult to calculate. It is therefore necessary to assign a unique and realistic route from origin to destination.

3.3.1.2.4 Composite mode

The composite mode includes maritime transport (container 20' or 40'). The transport between cities concerned by the study and the harbours (after and before the maritime part) can be made by truck, railway container or wagon.

For transport between cities and European harbours we have taken the railway container (20' or 40') as a basis. As a matter of fact, this part of the transport is not significant in the overall transport and the price difference between the other possibilities is too low to justify all cases to be studied (additional tables will be necessary and would be useless for this study).

The transport in the section between the C.I.S. harbours and the Central Asia concerned cities is realised with Russian 40-ton wagon.

Tariffs include prices of each stage of transport but exclude unloading (or loading) in Central Asia towns at departure (or arrival).

They are not the same in both the directions because of the maritime part. As a matter of fact, transport companies propose discount between C.I.S. and Europe as the traffic is less important in this way.

There is a number of routes; for each one, several European and C.I.S. harbours can be chosen that multiply the number of routes to study.

After listing the harbours to be considered in our study, as well in Europe as in C.I.S., several interesting connections between the cities and the European harbours. (These connections are hereafter attached) have been determined.

Then the corresponding tariff for 20' or 40' container has been estimated.

In order to complete the analysis the same work has been achieved between C.I.S. harbours and Central Asia cities included in the study.

3.3.2 Frequency and delays

3.3.2.1 Frequency

A daily service is usual for train and truck. On the other hand a 5 to 10 days previous notification delay is required for truck. This notification delay has not been taken into account.

For sea shipment to Riga, St. Petersburg and Illiychevsk, the service is available on a weekly basis.

A transshipment should be done at a South Italy port for sea freight to Poti. The frequencies of both the boats in connection are not the same. Service to South Italy ports is made on a weekly basis and from Italy to Poti with a half month schedule. Thus, the travel time can increase by one week if the connection is not properly synchronized.

3.3.2.2 Travel times

The data related to travel time have been independently collected for each part of the itineraries and gathered afterwards.

Average travel time have been used to allow the outcomes of this survey to be calculated.

The outcomes take into account the time spent between two ships departures then the connections are not synchronized. In this case, half of the period time between two departures has been added to the total amount of time necessary to cover to whole itinerary.

Time spent for transshipment operations is included in the outcomes. For example, two days are required for railway transshipment at the Russian frontier (wagon or container).

The time spent by truck for customs reasons is not included because this kind of delays are subject to tremendous variations.

The travel times are always reliable for the railway modes. This is not the case for the composite mode. This is quite understandable as the duration of the transport between two seaports is not only related to the distance existing between them, but can also be linked to other criteria such as frequencies, loading/unloading delays, connections existing with others destinations, the seaports sequence order...Lastly, travel times for truck mode have to be taken with caution since they can be subject to variations.

The travel times are obviously related to the routes followed. For example, the freight train coming from Russia to Ashgabat has to travel throughout the north part of the TRACECA routes (up to Tashkent). On the other hand, the route followed by trucks is shorter since they travel through Baku, the Caspian sea and the west part of Turkmenistan.

4. PRESENTATION OF THE RESULTS

The presentation of the outcomes is made with maps and data sheets (given in annex herewith attached).

This presentation allows to get in a more readable and understandable way both the itineraries, tariffs, and times limits.

The maps present in a synthetic way the detailed outcomes of the data sheets. For example, the survey allows to determine the more interesting routes according to tariffs and travel times, thus the maps give only those itineraries.

Two types of maps have been elaborated :

- By transport modes.

This type of maps gives a comparison of the routes between the various cities for different starting points and only one final destination, and reciprocally.

- By Origin/destination.

The best itineraries for each Origin/destination couple are presented in this set of maps.

4.1 Presentation of the results by transport modes

- Each map is specific to a mode.
- The aim of this map presentation is to provide simultaneously and in a synthetic way itineraries, tariffs and travel times results for each origin/destination couple.
- We present :
 - six maps for the composite mode (maritime 20' and 40-ton wagon),
 - one map for the 20-ton railway wagon,
 - one map for the last trip railway container,
 - and one map for the trucks.
- The large capacities are not representative of the price. They are only useful for some commodities. So these modes are not represented on the maps.
- Itineraries are shown schematically, in a characteristic style, specific of the transport mode. (For example the continuous line is given to the composite mode, please refer to the legend).
- In case of composite itineraries, a selection based upon costs and delays has been made before. We kept only three itineraries, one passing by Riga, one by Illiychevsk and the other one by Poti.
- Each mode needs a different representation :
 - For the composite mode routes, tariffs and travel time are given on two maps, one for each direction ; otherwise it would have been difficult to see the whole itineraries under the tables.
 - For the last trip railway container, itineraries from Central Asia to Europe are not possible ; so they are given only once.

- For the trucks, itineraries from Central Asia to Europe are not studied.
- Itineraries for railway wagons are the same in both the directions ; they are therefore shown only once.
- In addition of origins and destinations, tables give the most important places crossed (seaports, place of carriage transfer).
- The «/» symbol means that the relation does not exist or is not studied.

LEGEND

Maritime 20' and 40-ton wagon

For transit from Europe to Central Asia and back :

- Railway transport by 20' container between European cities and seaports
- 20' container shipping
- Railway transport by 40-ton wagon between Central Asia cities and their ports of entry (Riga, Illiychevsk, Poti).

Container

Only for transit from Europe to Central Asia :

- Railway transport by 20' container (last trip).

20-Ton wagon

For transit from Europe to Central Asia and back :

- Railway transport by 20-ton wagon between European cities and Brest.
- Railway transport by 40-ton wagon between Brest and Central Asia cities.

Truck

Only for transit from Europe to Central Asia :

- By 20-ton truck.

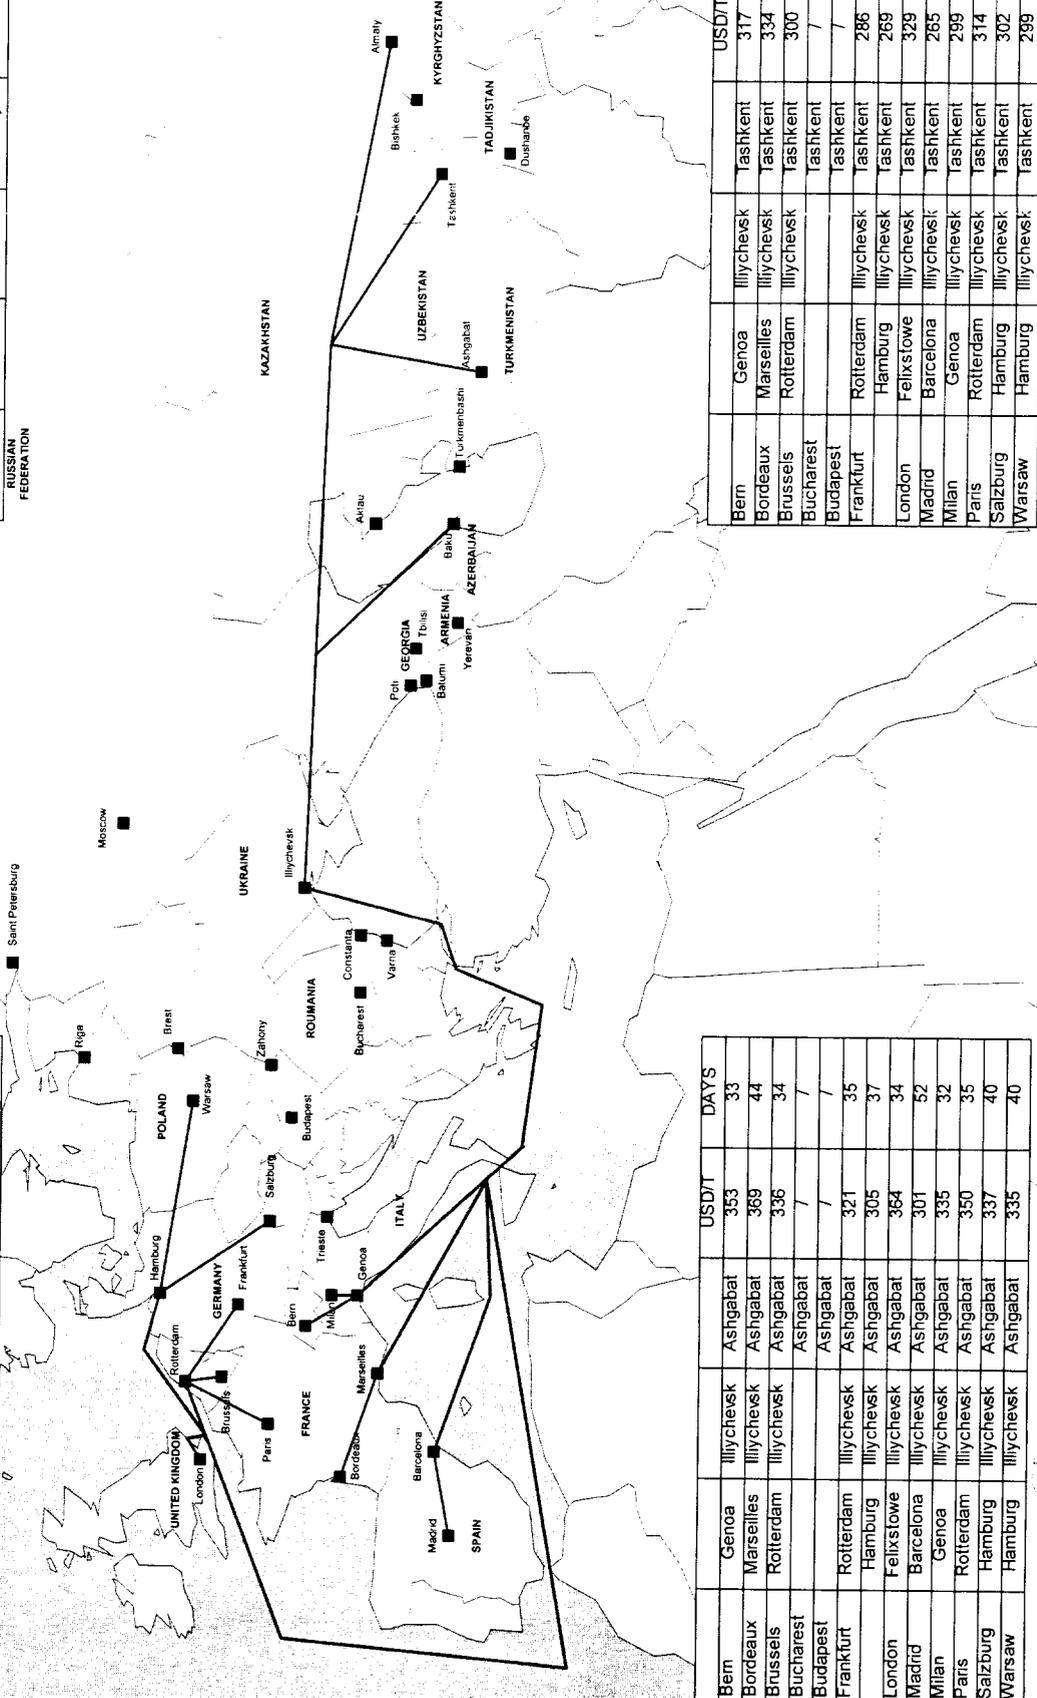

Only really used itineraries are indicated on the maps.

Itineraries with same tariff and travelling time in both the directions are indicated only once.

4.2 Presentation of the results by Origin/Destination .

- Each Origin/Destination map shows the itineraries, tariffs and delays of all the transport modes.
- The large capacities are not representative of the price. They are only useful for some commodities. So these modes are not represented on the maps.
- Itineraries are shown schematically, in a characteristic style, specific each transport mode. (For example the continuous line is given to the composite mode).
- Only 16 couples have been represented. It is enough because they are representative of the others. It has been the study's work itself which has permitted to draw or to throw aside the itineraries.
- The same selection of the composite itineraries has been made than in the mode maps.
- Tables for composite mode are given twice, because of the difference of tariffs and travel time in both the directions. Other modes do not need two tables
- In addition of origins and destinations, tables give the most important places crossed (seaports, place of carriage transfer).
- The «/» symbol means that the relation does not exist or is not studied.
- Each line from a Origin/Destination map table could be found in a mode map table.

LEGEND

Maritime 20' and 40-ton wagon

For transit from Europe to Central Asia and back :

- Railway transport by 20' container between European cities and seaports
- 20' container shipping
- Railway transport by 40-ton wagon between Central Asia cities and their ports of entry (Riga, Illiychevsk, Poti).

Container

Only for transit from Europe to Central Asia :

- Railway transport by 20' container (last trip).

20-Ton wagon

For transit from Europe to Central Asia and back :

- Railway transport by 20-ton wagon between European cities and Brest.
- Railway transport by 40-ton wagon between Brest and Central Asia cities.

Truck

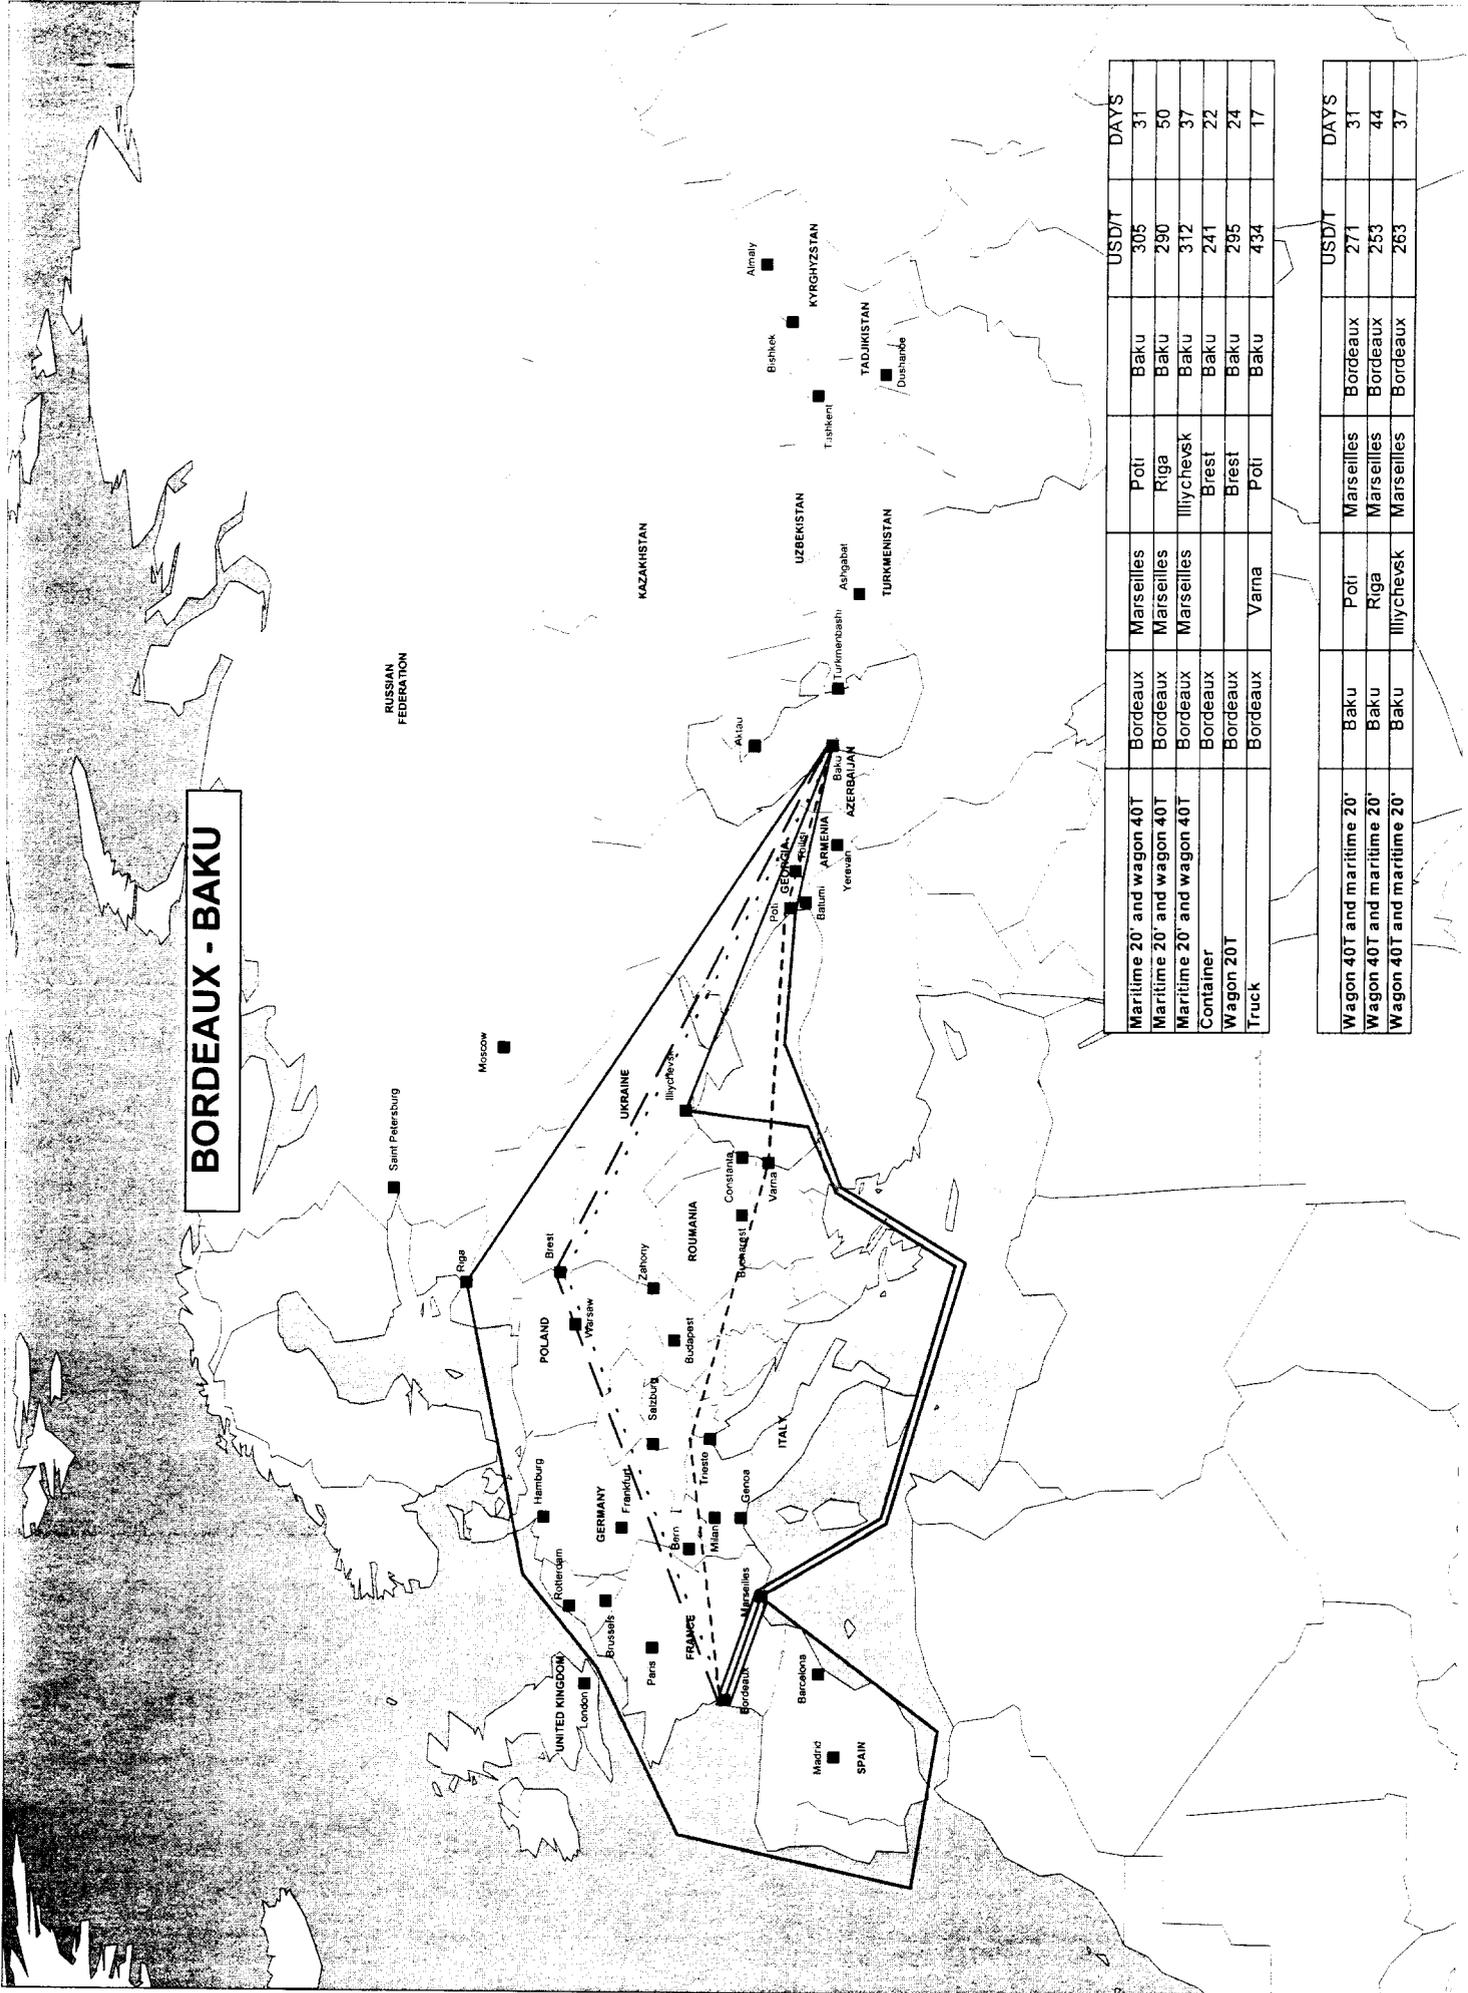

Only for transit from Europe to Central Asia :

- By 20-ton truck.

Only really used itineraries are indicated on the maps.

Itineraries with same tariff and travelling time in both the directions are indicated only once.

5. SYNTHESIS

The results produced in the present study give a snapshot of the tariffs and time limits condition of the freight transport between Europe and Central Asia by the time of the study realisation. Those results allow to get a better understanding of what are the major trends and difficulties of the transportation field in the TRACECA area. This synthesis presents what we consider to be the major aspects.

First of all, it may be of some importance to underline that the rapid economical and structural changes that have recently known the TRACECA area countries may affect drastically the results of this study. We strongly believe therefore that the tendencies and difficulties that are illustrated in this present study, could change under the state authority action of the TRACECA area countries and with the help of the European Community.

- On the whole, it has been a very hard work, for any person not involved in this type of job on a daily basis, to obtain precise and reliable information on tariffs, travel times and globally on transportation organisation in Central Asia. This lack of transparency, for western European operator, should curb the development of commercial relation with this area.
- For the time being, nearly all the railway traffic to and from Central Asia is realised via the Russian Federation. The considered development of both a railway corridor from western Europe via Romania and Bulgaria to the Black sea and a regularly ferry service from Illiychevsk, Constanta and/or Varna to Poti/Batumi, would open another reliable and competitive railway route to the far east. As we can estimate from our investigation, the impact on freight railway volume, tariffs and travel times from western Europe to Central Asia would be impressive.
- The comparison of tariffs and travel times between different transport modes (truck, railway, and composite railway & sea) demonstrates that the lorry shipping mode is far more expensive than the other modes and not necessary faster than the railway transport. On the other hand, the lorry mode still remains the most interesting way to assure a door to door delivery.
- The results of the same comparison between railway and composite (railway & sea) transport mode are not as obvious as the precedent comparison between truck and the other modes. Nevertheless, the following points and tendencies should be highlighted.
 - A huge disparity on tariff appears between different railway itineraries. For example, with a nearly comparable length route, the tariff from Poti to Almaty or Tashkent is almost double than the cost from Riga to Almaty or Tashkent. On the other hand, for some destinations like Baku or Ashgabat, the railway corridor between Poti and these cities is highly competitive.
 - For composite transportation via Black Sea seaports, the maritime part, that is not specifically in the field of our survey, represents nearly 50% of the total cost of the transport. Thus all the competitiveness of these routes is undermined by the maritime section of the transport.
 - Sea freight shipping via Russian seaports (Riga or St.-Petersburg) are always more competitive, in travel time and cost terms, than shipping made via Poti or Batumi. On this point, the comparison of tariffs of two representative sea routes : Genes-Riga or Genes-Poti, is eloquent.

It seems to be two major reasons for these huge differences on tariff and travel time between the two considered routes. Firstly, the Poti harbour installations are not large enough to afford the daily freight volume to be loaded/unloaded with the

currently existing installations. Waiting times for loading onto a container ship at the Poti seaport are among 10 days on average.

Secondly, should the Poti harbour installations problem be resolved, it would be of great interest to study how increasing the freight volume to Poti seaport could allow the tariffs to decrease and the shipping service frequency to improve. A rapid examination of this matter while realising the present study, seems to indicate that potential improvements are great.

In the present situation, the TRACECA corridor, is competitive only for a few couple of relation between Bern, Milan, Marseilles and Poti, Ashgabat, Baku, because of the major deficiencies that we have just pointed out.

The development of the TRACECA corridor should be obtained through an improvement not only of the railway services and tariffs, but also, of the port access to the corridor on the Black Sea. To some extent, the latter is the most important.

The potentialities of improvement are great. Sea freight could be improved in terms of tariff, travelling times, service frequency and harbour installations. The global organisation of railway transport by container in Central Asia could also be greatly improved by completing the relevant equipment of the major cities.

We believe that the sole decrease of the railway tariffs of the TRACECA corridor would be of minor impact on the global improvement of the system as long as the aforementioned improvements have not been realised.

This study has mainly been focused on the comparison of quantitative pieces of information such as tariffs, travel times and frequencies. The qualitative aspects have been raised in the course of the work; the outcomes issued from this activity have been examined with a transit expert assistance ; they appear as commentaries throughout the present document.

Some aspects that should have otherwise some impacts of the results of this study such as customs considerations, or specific consideration on railway of the TRACECA area, have been deliberately considered as being out of the specific field of this work. Lastly, the tariffs hereby gathered have not been the result of any negotiation that always occurs in real transactions, and have some influence on the final cost that could be obtained.

6. ANNEXES

All results are rounded up to the next unit.
